Imaging and quantification of kidney physiopathology

Hemodynamics and vascular disease

Hemodynamics and vascular disease

Hemodynamics involved in several vascular pathological processes

atherosclerosis

cerebral aneurysms

extra-cerebral aneurysms (AAA, ...)

intimal hyperplasia (grafts, bypasses, vascular access for HD, ...)

through the action of pressure, wall shear stress...

Image-based computational hemodynamics

Image-based computational hemodynamics

Important to get the geometry right.

Streamlined tools needed for the generation of unstructured grids from images, for the numerical approximation of Navier-Stokes equations (using finite elements, finite volumes, ...).

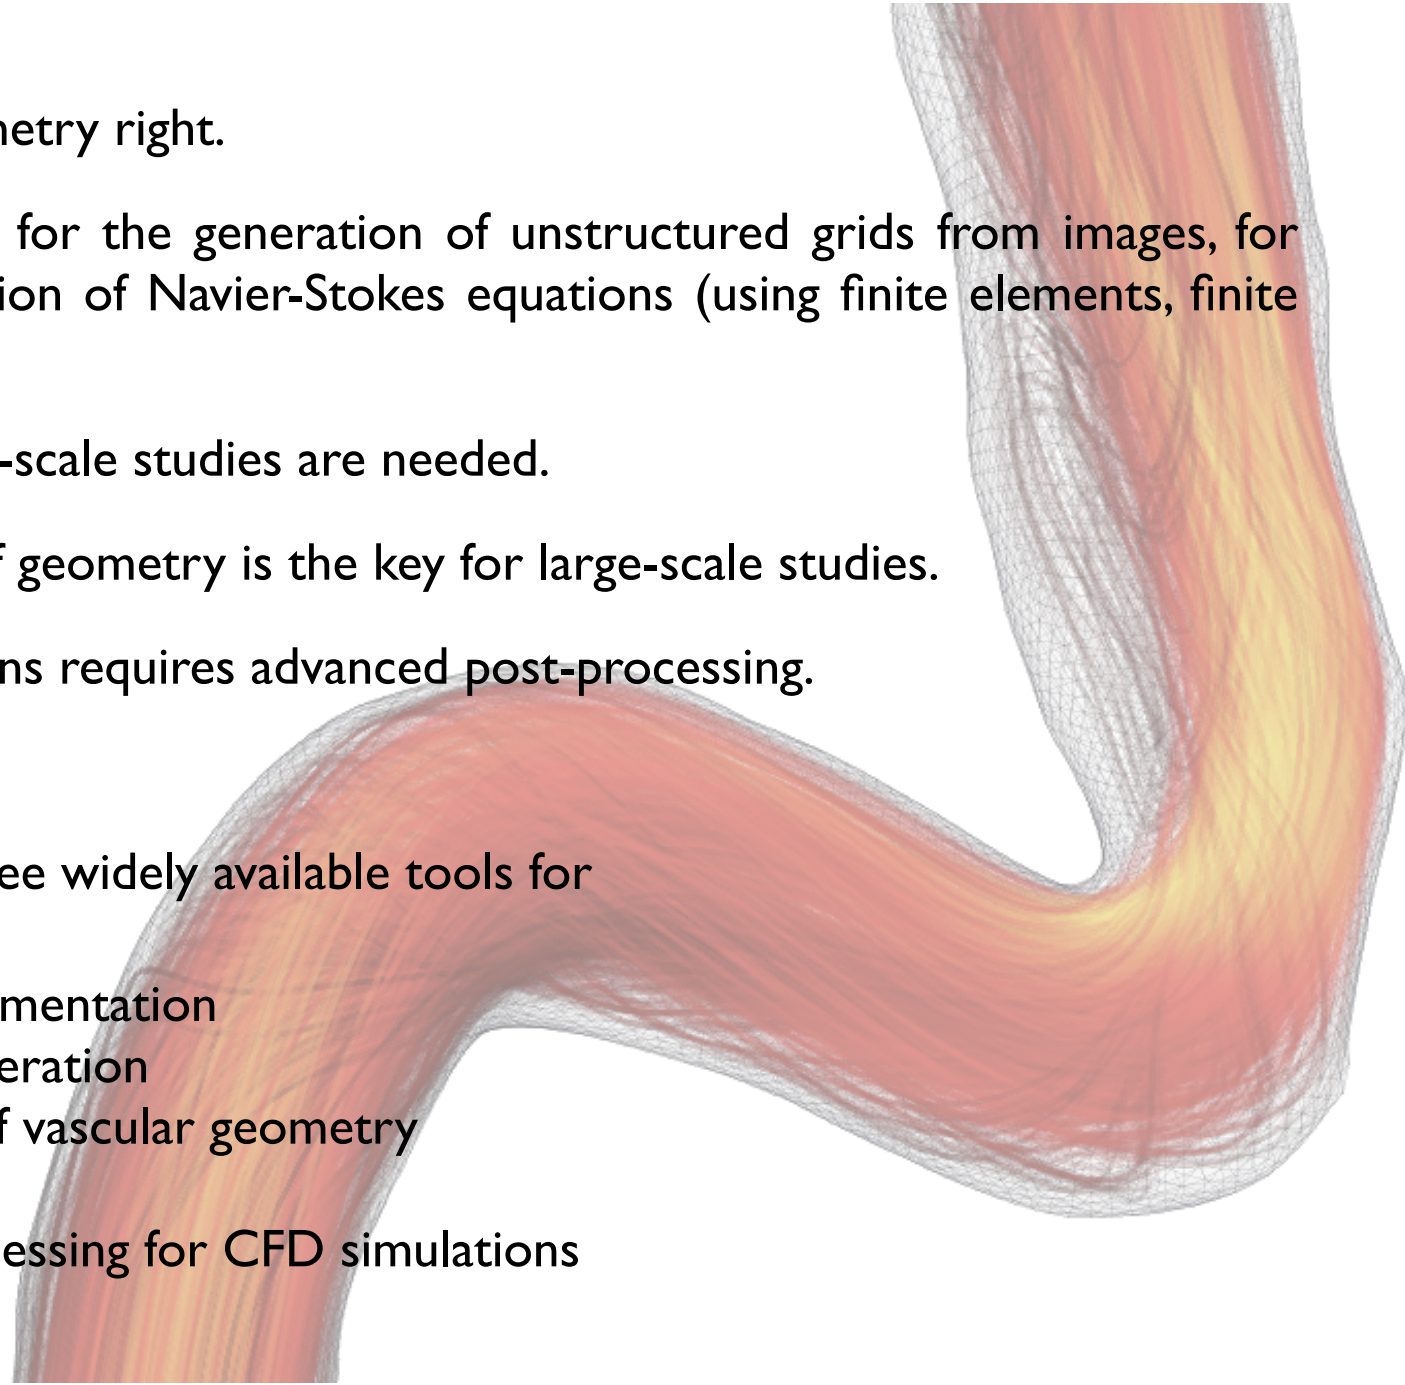

At the present stage, large-scale studies are needed.

Robust characterization of geometry is the key for large-scale studies.

Data analysis on populations requires advanced post-processing.

Effort: providing a set of free widely available tools for

- image segmentation
- mesh generation
- analysis of vascular geometry
- CFD
- post-processing for CFD simulations

The Vascular Modeling Toolkit

www.vmtk.org

Features:

- Level-set and deformable model segmentation
- Smart branch initialization and small-vessel level-set segmentation
- Image processing and vessel enhancement
- Surface processing (decimation, smoothing, healing, capping, ...)
- Surface remeshing
- Volume meshing (Tetgen)
- Centerline computation
- Geometric analysis of vessels, shapes, bifurcations
- CFD pre-processing (flow extensions, boundary layers)
- Finite element framework for surface mapping and CFD post-processing
- Surface mapping and patching for population studies

Geometric risk hypothesis for atherosclerosis

vmtk Slicer integration

vmtk - Vascular Modeling Toolkit

The Vascular Modeling Toolkit is a collection of libraries and tools for 3D reconstruction, geometric analysis, mesh generation and surface data analysis.

NA-MIC
National Alliance for Medical Image Computing

Summary of past and ongoing projects at project weeks

vmtk Slicer integration

- automated generation of command line modules for non-interactive vmtk tasks (done)
- vmtk C++ code in Slicer as a library (done)
- interactive Slicer modules for segmentation, etc. (with Daniel Haehn) (in progress)
- vmtk Slicer as a NITRC project (to do)

NA-MIC

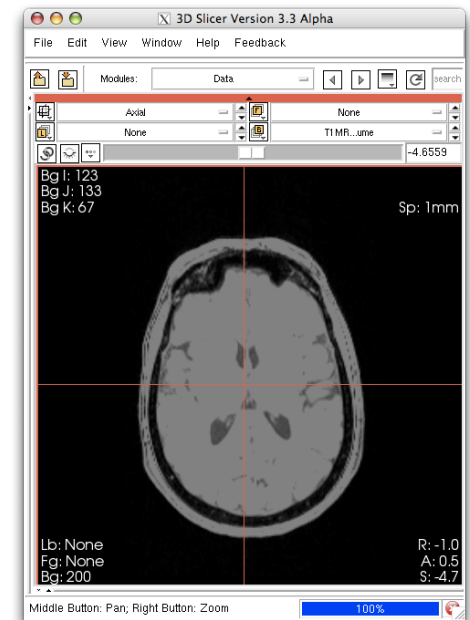

National Alliance for Medical Image Computing

Summary of past and ongoing projects at project weeks

Engineering core:

- Python interface and modules (with Dan Blezek) (done)
- Reference system issues for orientation-unaware command-line modules (done)
- Breakout sessions: AHM 2008, AHM 2009

```
>>> from Slicer import slicer
>>> scene = slicer.MRMLScene
>>> node = scene.GetNodeByID('vtkMRMLScalarVolumeNode1')
>>> arr = node.GetImageData().ToArray()
>>> type(arr)
<type 'numpy.ndarray'>
>>> arr.max()
367
>>> arr[arr>200] = 200
>>> node.Modified()
```

NA-MIC

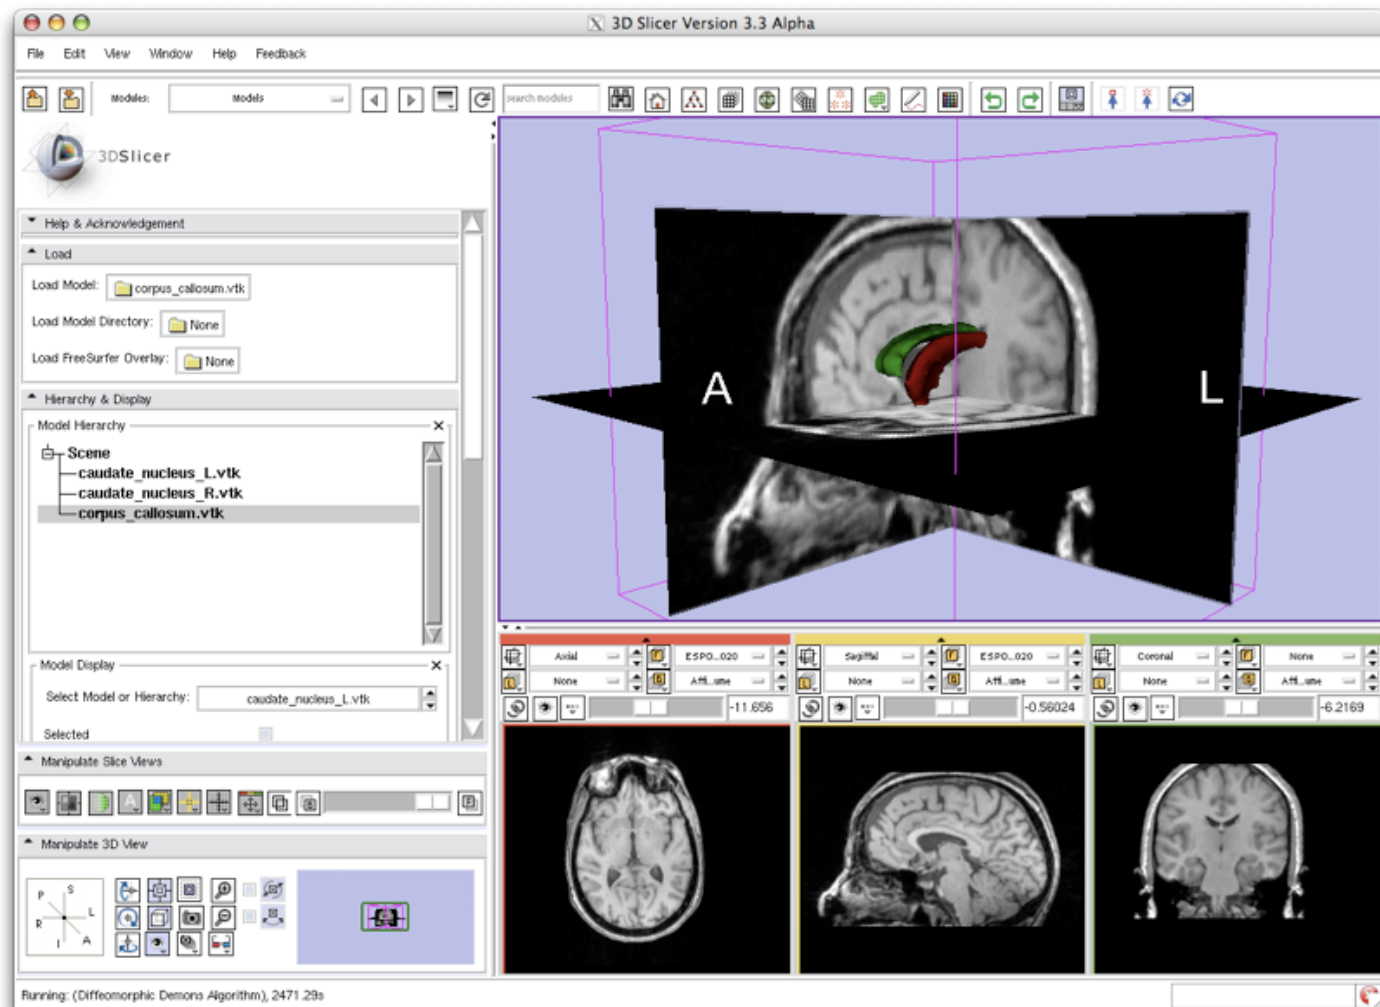

National Alliance for Medical Image Computing

Ongoing projects back home

With Roberto Foroni, University of Verona:

Pre-operative planning and intra-operative visualization platform for minimally-invasive neurosurgery

- Registration (affine, diffeomorphic demons), segmentation (EM), vessel extraction (enhancement, EM, level sets)
- Integrated visualization
- Slicer layout customization
- Workflows

Mario Negri Institute:

Image quantification in autosomal dominant polycystic kidney disease (ADPKD)

- ADPKD: responsible for the majority of ESRD among hereditary kidney diseases, currently no treatment available
- currently at the Mario Negri Institute: 3 clinical trials on treatment with imaging endpoints (MR and CT)
- identified imaging evidence for key components for functional loss (Antiga et al, CJASN 2006; Caroli, ASN 2008)

Ongoing projects back home

Mario Negri Institute:

- Slicer as a platform for image quantification in autosomal dominant polycystic kidney disease (ADPKD)
- Image analysis methodology has been developed (ITK)
- A complete set of Slicer modules will be created during the next months

Last slide: Meshing module!
